## Participants & Sample method

---

The focus of this survey is to gather the opinions of students about adding a sports program. For that reason the participants will be students ranging from Freshman to Senior. Ideally this survey would be given to all students via email to get as close to a consensus as convenience sampling would allow. Alternatively, if that's not possible, I'd suggest the use of stratified sampling by dividing participants into strata defined by popular majors and year to hopefully eliminate any possible sampling bias caused by certain cohorts being more likely to respond to the survey.

## Sample size

---

The ideal sample size would be based on the total number of students enrolled. I would use Cochran's formula to come up with the numbers using the standard 90% confidence interval with 5% margin of error.

## Questions

---

**1. What year are you in?**

To gain basic demographic information.

**2. What is your gender?**

To gain basic demographic information.

**3. Are you interested in participating in or supporting a sports program?**

The intent of this question is to identify how many students would be interested in participating in the program versus just supporting it by attending games. Without enough players, a sports program would fail, regardless of how many students would like us to have one.

**4. Which type of sports program would you prefer?**

To determine the type of program the students would like.

**5. What sports should Nevada DATA College offer?**

This question identifies specific sports and can be filtered by question three to see what games potential players are willing to play.

**6. Would you be willing to pay additional fees or tuition to support a sports program?**

This is a general question about funding and can also be used to see how invested the student body is in the program—whether they are passively interested or actively wanting the program, regardless of whether extra funding is actually needed.
